NEW ABSTRACT

A cutting member for shaving hair including a metal substrate provided with a cutting edge. At least a portion of the substrate including the cutting edge is provided with a protective coating including stacked pairs of layers, wherein each pair of layers includes a first mainly carbon layer and a second mainly metal layer. Each pair of layers has a thickness between 1 and 10 nm. The second layer may mainly include one of Cr, Nb, Mo, Ti, V, and W. In one embodiment, the second layer includes Cr and each pair of layers has a thickness of 1.8 nm. An implanted layer of Cr may be between the substrate and the pair of layers which is closest to the substrate. A basic layer of CrN may be between the implanted layer of Cr and the pair of layers.
